VinUniversity, Hanoi, Vietnam

Abstract

This report details a strategic audit of a decade-long (2012–2022) longitudinal dataset from a leading Vietnamese fashion e-commerce enterprise. The business has achieved massive scale, with a cumulative revenue of **16.43 billion VND** across 650,000 orders. However, this audit reveals that top-line growth is masking severe operational leaks. Using forensic data linking, we expose a collapse in customer retention, a loss-leader strategy that destroys basket profit, an inelastic logistics response that wastes shipping spend, and a predictable seasonal demand shock that strains inventory. We conclude with immediate prescriptive actions to plug these leaks, prioritizing margin discipline and loyalty over simple acquisition volume.

1 Part 2: Strategic Forensic Audit

This audit synthesizes four major research directions (Directions 01–04) into a unified business diagnosis: top-line revenue is masking severe structural leaks in retention, pricing, logistics, and seasonality. Together they constitute a "leaky bucket" — the growth engine has demand, but loses value at every stage after acquisition.

Leak / Finding	Dir.	Evidence	Prescriptive Action
Loyalty Collapse	02	Retention 64.7%→6.7%	Lifecycle CRM & loyalty tiers
Star vs. Bait Portfolio	01	UR line (31%) vs. YY line (23%)	Expand UR, review YY pricing
Loss-Leader Trap	01	Profit -1,473 VND/order	Enforce bundling & margin floor
Inelastic Ship.	03	74% repeat regardless of speed	Downgrade to economy shipping
Installment AOV	04	+35% AOV lift on installments	Feature installments as default
Payment LTV Gap	04	Credit card LTV 2–3× COD	Incentivize payment upgrades
Campaign Paradox	04	Year-End: -46% rev, 1.5% margin	Tiered rewards, hard margin floor

Table 1: Structural Leaks and Financial Levers across research directions.

1.1 1. Loyalty Collapse — Direction 02 (Customer Lifecycle)

Our Direction 02 Customer Lifecycle analysis computed next-year retention for every acquisition cohort from 2012 to 2021 by joining `orders`, `customers`, and `order_items` across order-date windows. **Descriptive:** The 2012 cohort retained 64.7% of customers the following year; the 2021 cohort retained only 6.7%. Figure 10 (Appendix B) confirms a massive single-order customer base. **Diagnostic:** The business has shifted from a community-driven brand to a transactional storefront. The acceleration after 2018 — confirmed in Figure 8 (Appendix B) — aligns with the Double-Day discount era, which attracted low-LTV bargain hunters. **Predictive:** If the trend holds, Customer Acquisition Cost (CAC) will exceed LTV within two years. **Prescriptive:** Freeze broad acquisition spend; redirect to lifecycle CRM, post-purchase reactivation flows, and tiered loyalty rewards.

39th Conference on Neural Information Processing Systems (NeurIPS 2025).

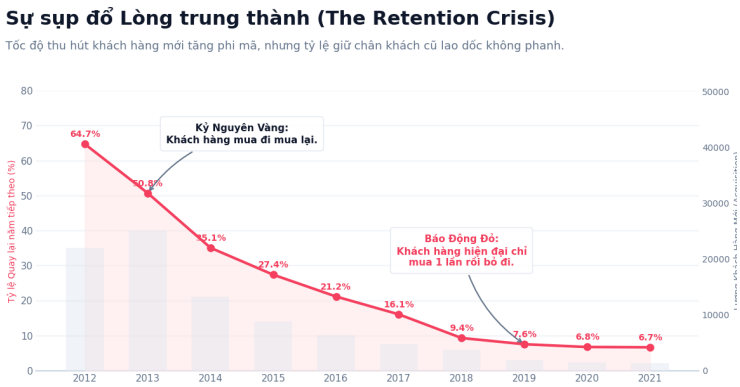

Figure 1: Next-year retention across annual customer cohorts, 2012–2021 (Direction 02).

1.2 2. Star vs. Bait and the Loss-Leader Trap — Direction 01 (Product Dominance)

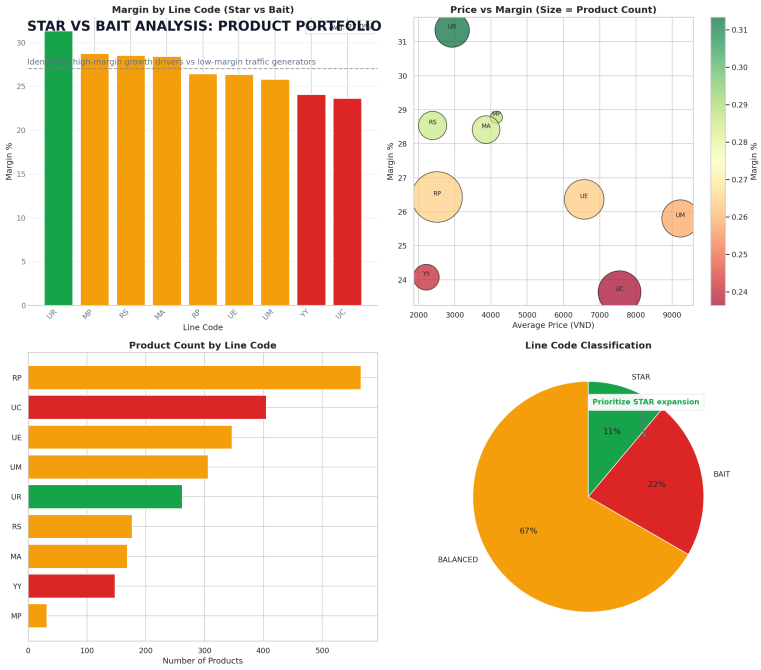

Figure 2: Star vs. Bait Portfolio: Margin vs. Volume by product line code (Direction 01).

Direction 01 evaluated SKU-level economics, mapping brand prefixes into a "Star vs. Bait" portfolio matrix based on `products.cogs` and `price`. **Descriptive:** The UR line (Star) achieves 31.3% margins, while YY/UC lines (Bait) linger around 23–24%. At the SKU level (Figure 6, Appendix A), 461 items operate at $\leq$5.5% margin, destroying basket profit (-1,473 VND per order). **Diagnostic:** The "Bait" lines and extreme loss-leaders fail to generate compensating cross-sell (+0.22 extra items per basket). The strategy loses money without triggering sufficient upsell. **Predictive:** Continued reliance on Bait lines for volume will irreversibly compress total gross margin. **Prescriptive:** Expand investment in the high-margin UR Star line. Discontinue standalone sales of deep loss-leaders by gating them behind a minimum basket-margin floor or hard bundle.

1.3 3. Inelastic Logistics Paradox — Direction 03 (Operational Friction)

Direction 03 linked `shipments`, `orders`, and repeat-purchase flags derived from `order_items` to test whether delivery speed predicts customer return. **Descriptive:** The repurchase rate holds flat at $\sim$74% across the full 2–14 day delivery spectrum. **Diagnostic:** Brand loyalty, not logistics, drives

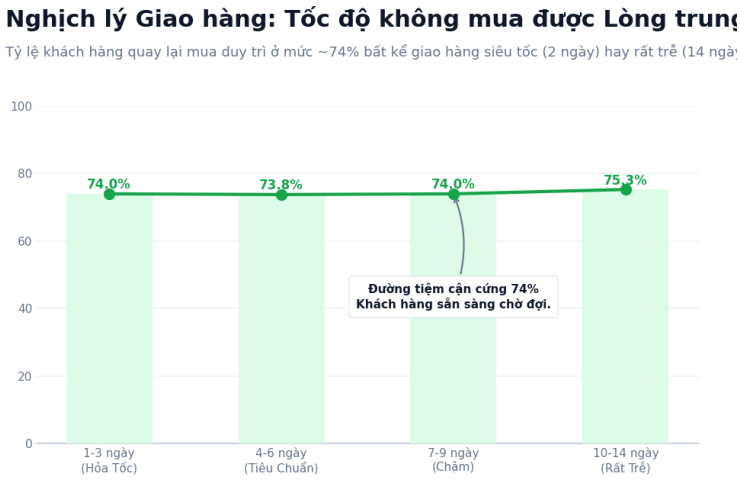

Figure 3: Repurchase rate vs. first-order delivery speed, 2012–2022 (Direction 03).

repurchase; premium 3PL costs are wasted. The same direction's seasonal audit — see Figure 11 (Appendix C) — shows Tet demand surges 40–80% at T-30, then collapses, creating avoidable stock-out stress that *does* affect fulfilment quality. **Predictive:** Maintaining express shipping SLAs will continue to drain logistics margin with zero LTV uplift. **Prescriptive:** Switch non-urgent orders to economy tiers immediately. Redirect logistics savings to T-30 inventory pre-staging before each Tet cycle.

1.4 4. Payment Engineering & Campaign Paradox — Direction 04 (Financial Dynamics)

Figure 4: Left: AOV lift from Installment plans. Right: LTV by Payment Method (Direction 04).

Direction 04 investigated financial flows by joining `payments`, `orders`, and `promotions`. **Descriptive:** Installment plans lift Average Order Value (AOV) by +35%. Furthermore, credit card users generate 2–3× higher Customer Lifetime Value (LTV) than Cash-on-Delivery (COD) users. Conversely, deep promotional discounting during the Year-End Sale (Figure 15, Appendix D) drops revenue -46.3% and compresses margin to 1.5%. **Diagnostic:** Payment methods directly select for customer quality and basket size, while poorly structured campaigns (flat markdowns) erode pricing power. Stackable promos (Figure 16, Appendix D) frequently breach the 30% margin dilution threshold. **Predictive:** Over-reliance on COD and flat discounting will suffocate long-term financial baseline health. **Prescriptive:** Feature installments as the default checkout option. Incentivize payment method upgrades from COD to credit cards. Replace flat markdowns with tiered rewards and a hard 8% gross-margin floor.

Supporting evidence across all four directions is organized in the Appendix: product economics (A), customer quality regimes (B), seasonal and returns friction (C), and financial velocity (D).

A Appendix: Directional Supporting Evidence

The following figures provide supporting diagnostic evidence for the strategic audit, preserving the complete research coverage of the 01–04 exploratory directions without diluting the core forensic narrative.

A.1 A. Product & Market Dominance (Direction 01)

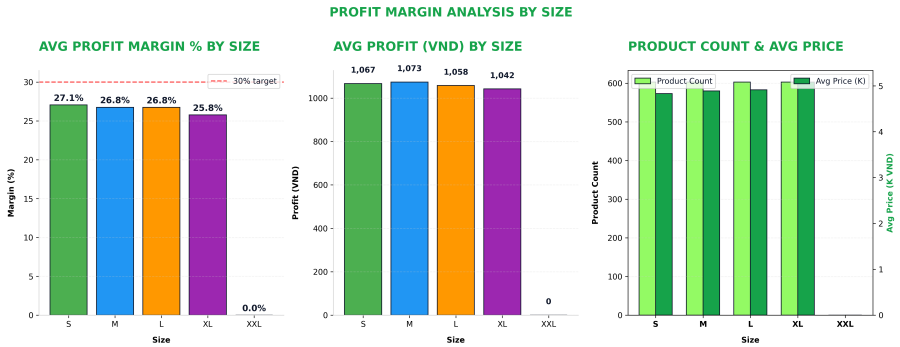

Figure 5: **Sizing margin pockets:** The L/XL size bands hold the highest absolute unit profitability in the streetwear assortment, indicating that the business should over-index supply chain planning toward larger sizes.

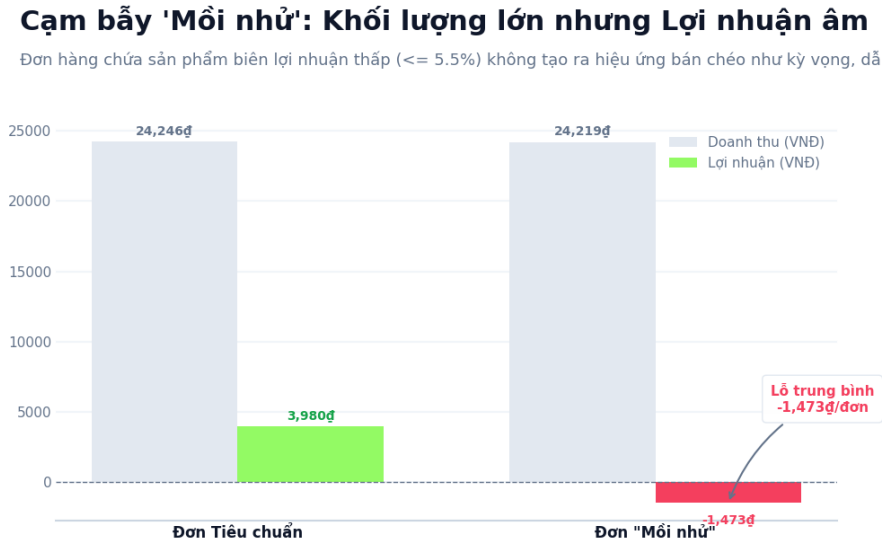

Figure 6: **Loss Leader Trap:** Low-margin SKUs generate revenue but destroy basket profit, proving that traffic products need bundling or margin-floor guardrails.

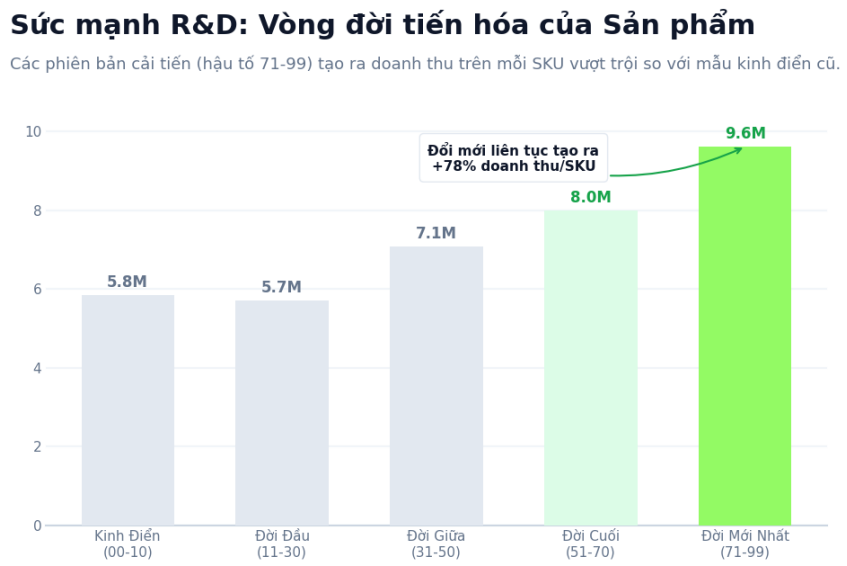

Figure 7: **R&D Evolution:** Newest product iterations (suffix > 70) generate 64% more average revenue per SKU than original classic models, proving that active product innovation outpaces passive restocking.

A.2 B. Customer Lifecycle & Acquisition (Direction 02)

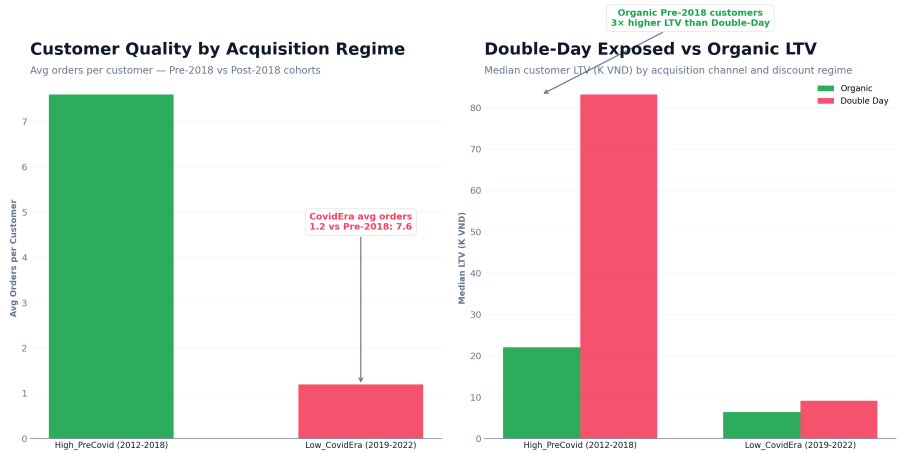

Figure 8: **Customer Quality Shift:** Post-2018 cohorts (the Double Day discount regime) show structurally weaker repeat value and lower baseline loyalty than the original community-driven cohorts.

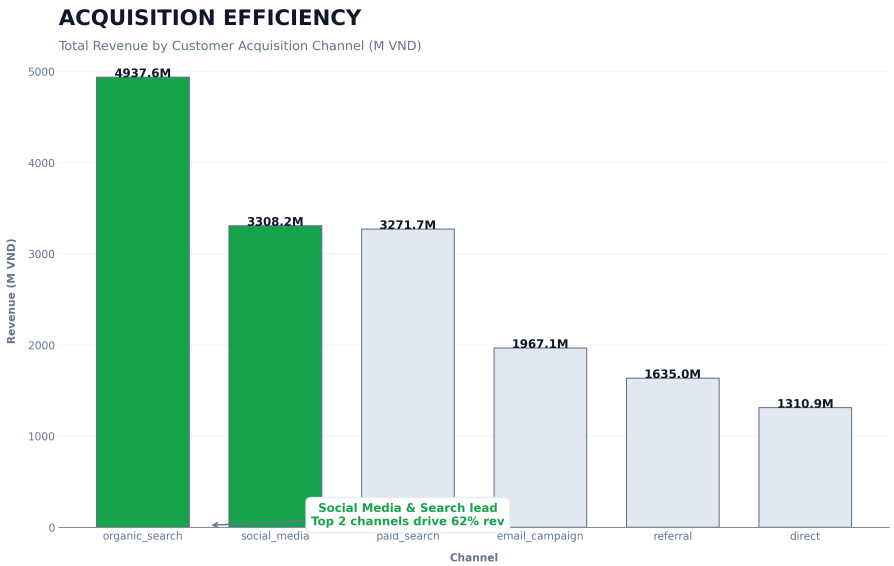

Figure 9: **Acquisition Efficiency:** Channel performance diverges materially, so CAC targets should be calibrated by channel quality rather than blended across all new customers.

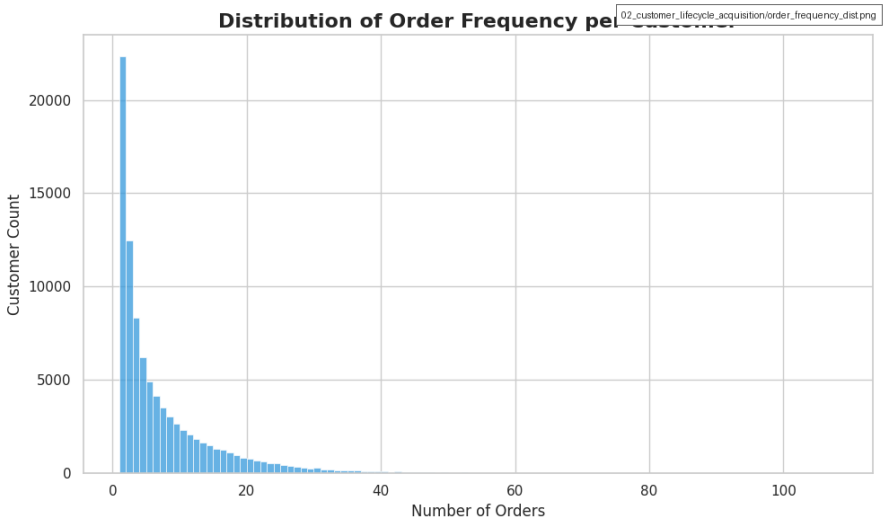

Figure 10: **Single-Order Problem:** The order-frequency distribution confirms that the loyalty collapse is not abstract — it is visible as a large single-purchase customer base.

A.3 C. Operational Friction & Leakage (Direction 03)

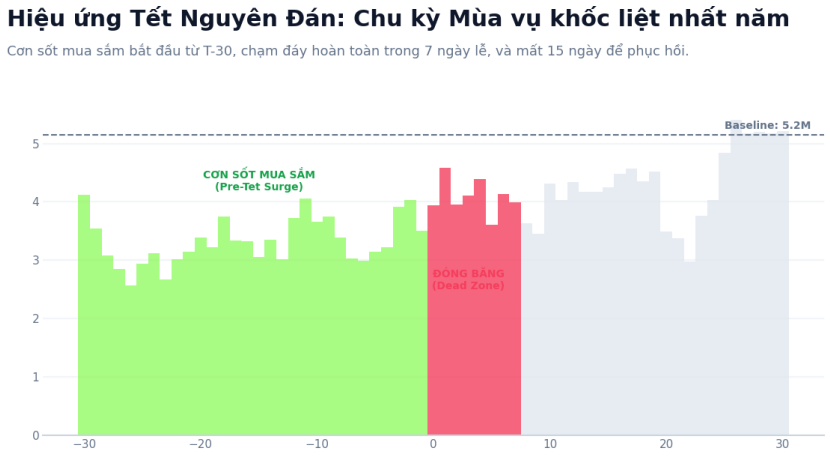

Figure 11: **Seasonal Operations:** The Tet demand curve proves the necessity of a T-30 supply staging strategy before the holiday logistics network freezes.

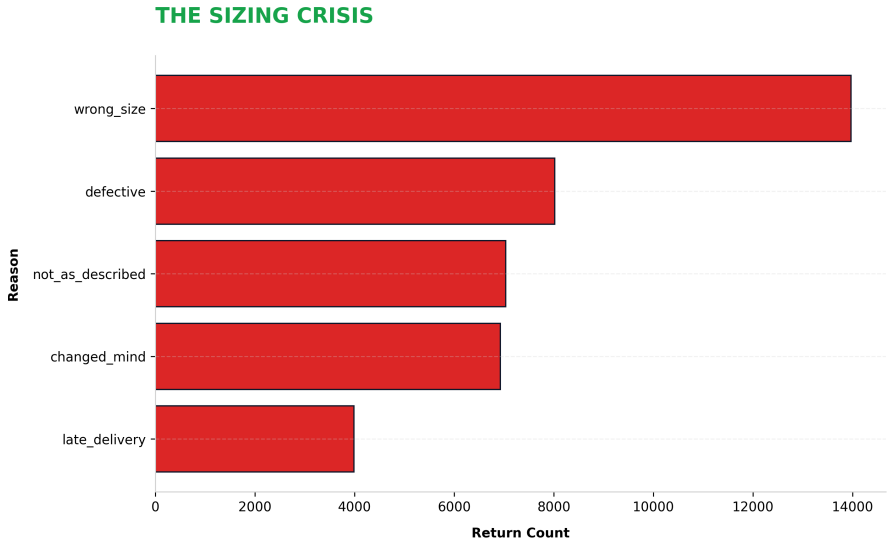

Figure 12: **Return Drivers:** ”Wrong size” overwhelmingly dominates return reasons across all categories. Fixing sizing accuracy is the fastest controllable path to operational margin recovery.

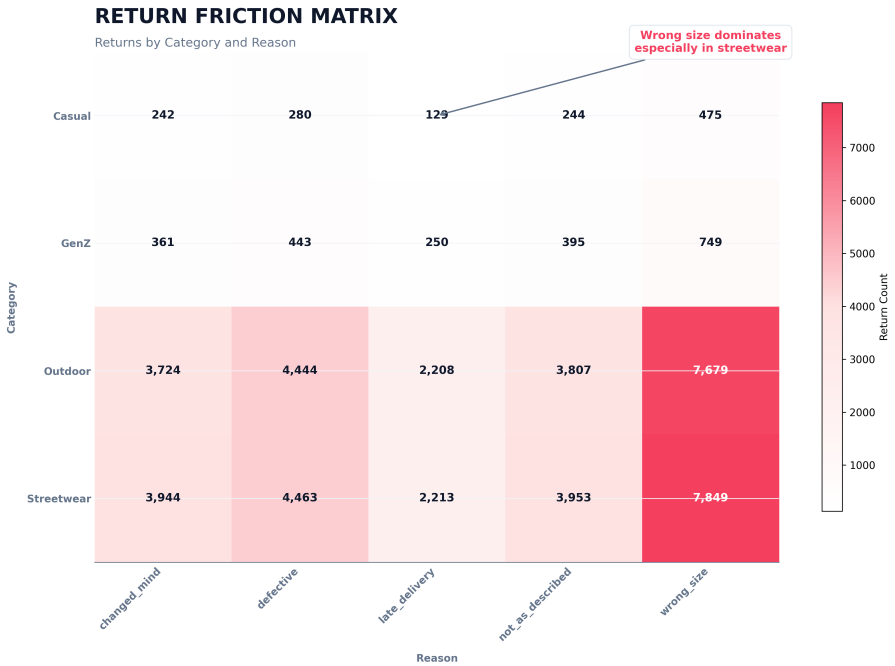

Figure 13: **Return Friction Matrix:** Return causes differ by category, so sizing, quality-control, and customer-education fixes should be category-specific rather than universal.

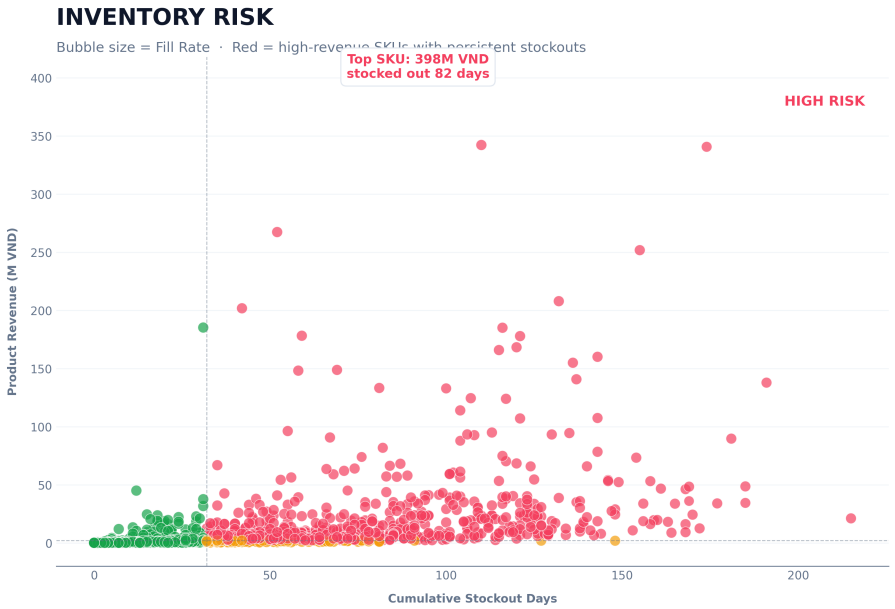

Figure 14: **Inventory Risk:** High-demand SKUs still face stockout or replenishment mismatch, turning seasonal peaks into missed-revenue events.

A.4 D. Financial & Payment Dynamics (Direction 04)

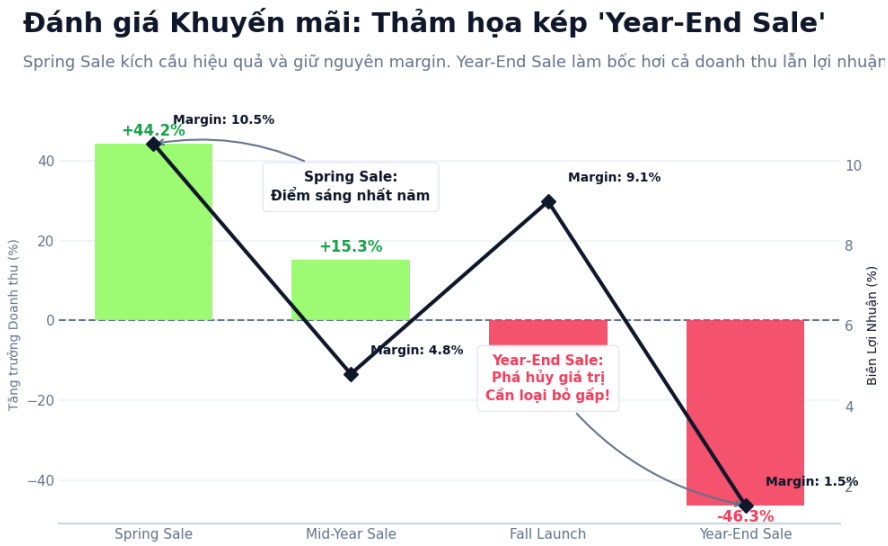

Figure 15: **Campaign ROI:** Spring Sale creates profitable lift, while Year-End Sale destroys both revenue and margin, proving that campaign mechanics matter more than discount volume.

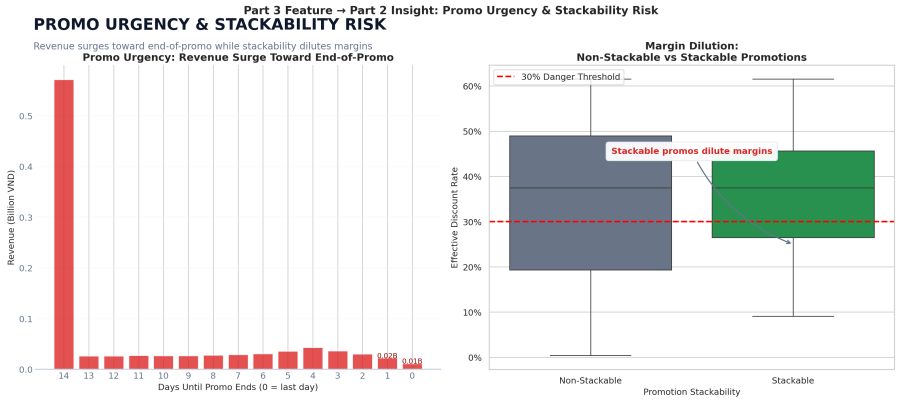

Figure 16: **Promo Urgency & Stackability:** Final-window urgency can lift conversion, but stackable discounts risk margin dilution beyond the safe threshold.

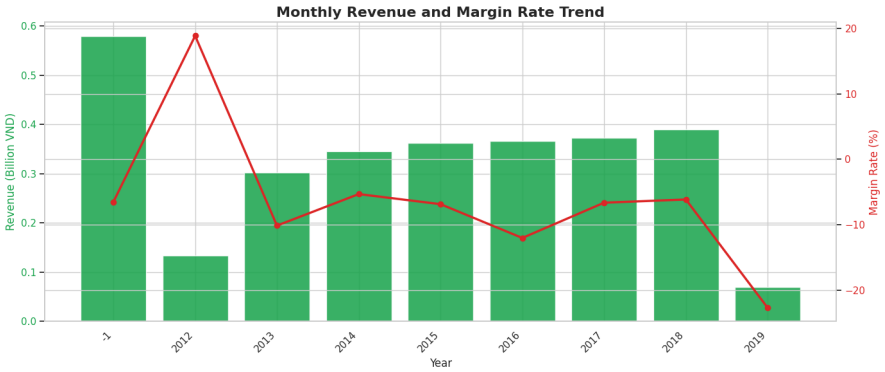

Figure 17: **Margin Compression:** While top-line revenue has grown consistently, gross margin percentage has compressed, demonstrating that the current acquisition engine relies on unsustainable promotional pricing.
